www.lavorpro.com

Lavor is on line

offering a website rich with information about the company and its products. The site is easy to explore thanks to a navigation system organised around simple and straightforward steps, with continually updated data.

www.lavorpro.com

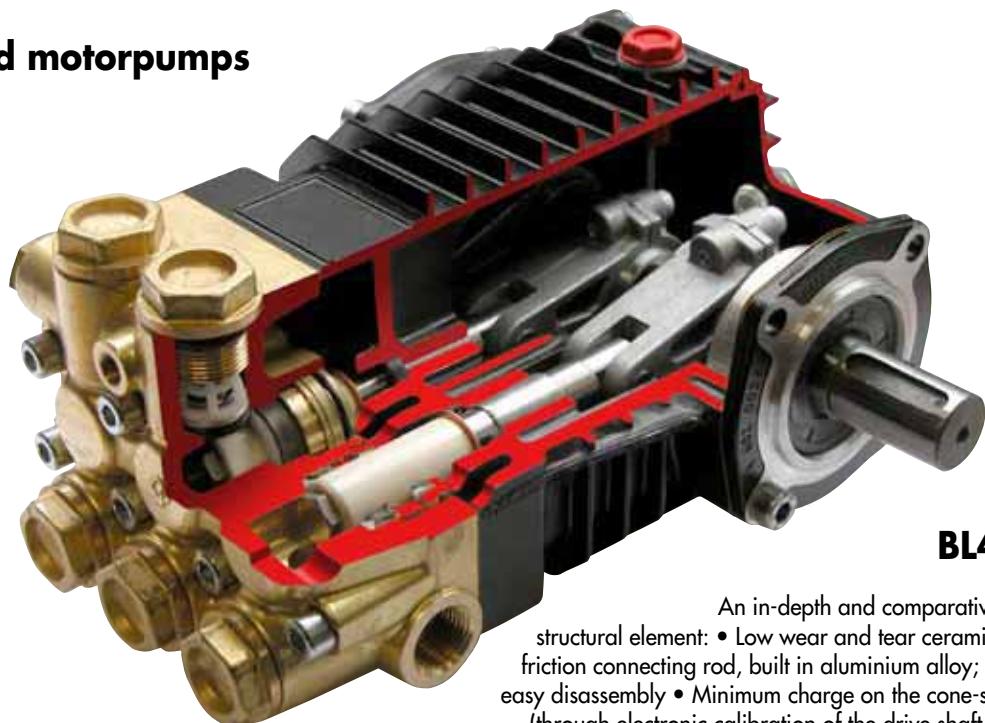

also features a B2B service enabled by accessing a reserved area after registering your own personal password. Orders are simple to make and send, ensured by the speed with which it is possible to consult our products and thanks to our "shopping basket" feature. The site also includes a series of instant icons to review and check the status of your order as well as see past orders.

www.lavorpro.com

connecting to the LAVOR world is just a click away: information, products and news at the fingertips of every navigator.

Pumps and motorpumps

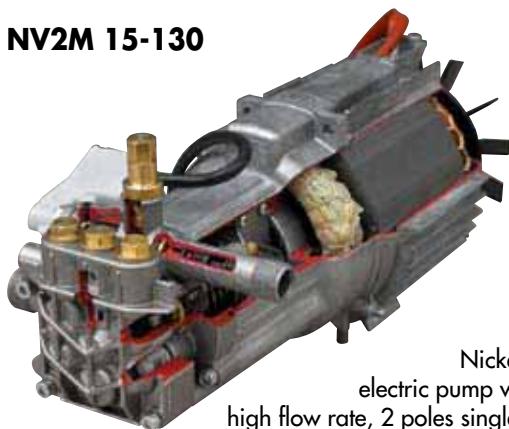

**BL4 21-200**

An in-depth and comparative study on each structural element:

- Low wear and tear ceramic pistons
- Low friction connecting rod, built in aluminium alloy; double body for easy disassembly
- Minimum charge on the cone-shaped bearings (through electronic calibration of the drive shaft rotation)
- Very low operating temperature, favored by the use of water cooled motor
- Top range up to 21 l/min.

NV2M 15-130

Nickel-plated head electric pump with adjustable high flow rate, 2 poles single-phase motor (2,6 kW). The most innovative entry level model in the world: it combines the two washing phases (dirt degreasing = high-pressure / fast rinsing = high flow rate) till 15 l/min like three-phase machines.

NX2M 9-130/BX2M 9-130

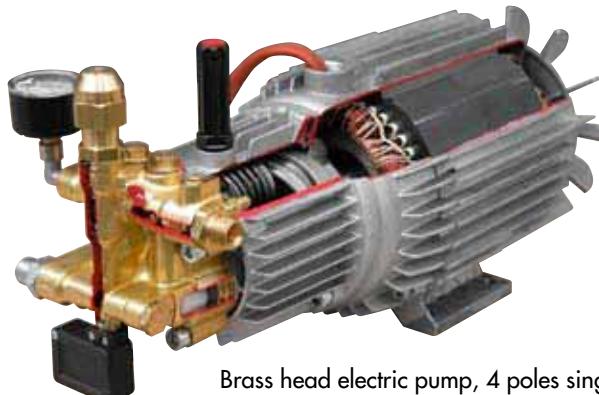

Nickel-plated or brass head electric pump, 2 poles single-phase motor (2,6 kW). Compact professional pump, that uses top quality components.

BX2 13-200

Brass head electric pump, 2 poles single or three-phase motor up to 4,7 kW. It is the most resistant 2 poles pump on the market (reinforced with rubberized fabric seals, valves with S/S plate, ceramic coated pistons), it surpasses competitors' 4 poles pumps.

BX4 11-150

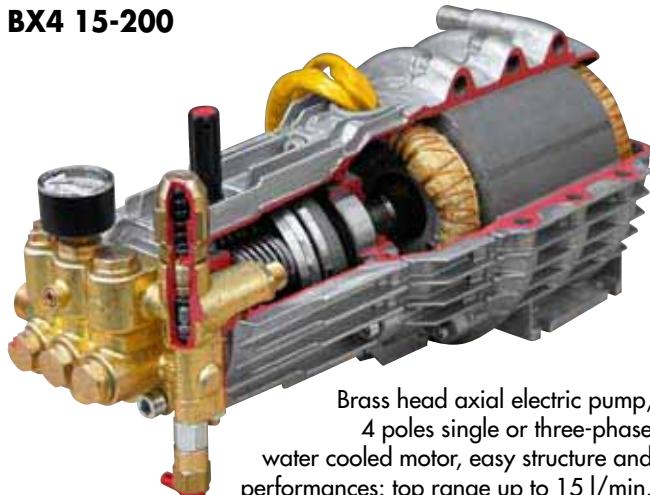

Brass head electric pump, 4 poles single or three-phase motor up to 3,7 kW. 1450 RPM rotation (50Hz) grants low friction and high silence level, even though the structural easiness. It can bear nonstop heavy duty use in the single-phase level.

BL4 12-160

Linear brass pump head, 4 poles single or three-phase motor up to 4 kW. Connecting rod pump, good relation performances / competitiveness in the 12 liters 4 poles motor range.

BX4 15-200

Brass head axial electric pump, 4 poles single or three-phase water cooled motor, easy structure and performances: top range up to 15 l/min. Connection with water cooled motor lowers operating temperature. It can bear nonstop heavy and extreme duty use.

Efficiency, reliability, safety and ease of use are the basic factors for a careful selection of a professional product. On the ground of these standards, Lavor PRO has conceived professional line high-pressure cleaners, in order to match, through high-tech products, perfect hygiene and clean with time/labour saving.

Being Manufacturers: from experience to knowledge

In the high-pressure cleaners market companies are divided in those who buy components to assemble products and manufacturers, who have a continuous R&D on all product components.

Lavorwash manufactures all the high-pressure cleaners components entirely and this allows: to spread product knowledge, culture and experience inside the company; to check the entire manufacturing cycle; to adopt possible improvements immediately; better sensitivity to market request adjusting product range design in real time.

What high pressure cleaner? Is it better pressure or delivery rate?

The right criteria to define the high-pressure cleaner performances is the washing effectiveness.

The elements that influence this value are: delivery rate (water volume processed by the pump in a unity of time) and pressure (l/h water power on a surface). The higher the delivery rate, the faster the washing phase (less rinsing time); the higher the pressure, the deeper the washing (better dirt degreasing).

It is often emphasized the pressure only (also because the pump size and the consequent manufacturing cost are cheaper), but delivery rate is as important as pressure.

What pump? Is it better a linear (crankshaft) or an axial one?

It does not exist a winning technology, because both solution can provide same performances and lifetime. What determines the pump quality is the quality of the project itself (linear or axial) and of the components used; for this reason Lavorwash decided to develop both technologies, taking into consideration a design that grants margin of safety and reliability.

What design? Is it better horizontal or vertical construction?

The design of a cold water high-pressure cleaner can have an horizontal development (ex. ONTARIO) or a vertical one (ex. MICHIGAN) and also the pump position follows the orientation of the structure.

The vertical development is much more ergonomic for the user, because machine moving and storing after use are much easier, but these benefits raise manufacturing cost.

The horizontal development allows an easier pump service if needed, better stability and a lower manufacturing cost.

WOBBLE PLATE**• Axial pump:**

The movement of the (3) pistons occur through the rotation of an inclined wobble plate (advancement) and springs (return). The longitudinal axles of the pistons (placed at 120° each other) is coaxial to the motor rotation axle. Simple manufacture, there are few moving elements.

CRANKSHAFT**• Linear pump:**

The movement of the (3) pistons occur through a system of connecting rods and crankshaft. The longitudinal axle of the pistons (placed at the same level or linear) is perpendicular to the motor rotation axle. It is more versatile to bear high delivery rates (from 21 l/min) and it has a better self priming.

WATER COOLING**• Water cooled motor:**

Water flows through the S/S coil around the motor, this allows a better thermal exchange (and so a cooling) than air also in those countries where inlet water could reaches 60°C. This allows a drop in operating temperature of the motor and pump mechanical elements, granting a better reliability and longer life.

T.V. Thermal Valve**• Thermal valve:**

When the gun trigger is released, the same water flows through the pump (by-pass) and it overheats and sooner or later this damages the valve seals. With this completely mechanical system, the thermal valve checks the temperature in the pump, opening / closing the by-pass circuit letting new and fresh water flow inside before the elements are damaged. Simple solution without electronic devices.

T.S. Total Stop**• Total Stop:**

Releasing the gun trigger the pump stops automatically avoiding element damages during the by-pass phase. Pulling the trigger, the high-pressure cleaner starts automatically. Max pump protection.

T.S. Total Stop 24V**• Low voltage and delayed Total Stop:**

To avoid quick and multiple start and shut down of the motor/pump group whenever the gun trigger is pulled and released, this disposal delays of about 15 seconds the machine shut down. Prevention, energy saving, top safety and pump longer life.

1450 RPM**• Motor low rotation speed:**

The electric motor transfers the same number of revolutions to the pump. With a 4 poles motor there is a lower rotation speed of the components (1400 RPM in case of 50Hz or 1750 RPM in case of 60 Hz) granting longer pump life. Extending lifetime solution.

**• High-pressure detergent suction:**

Chemical product (flowing though the pump) are supplied at the same operating pressure of the machine. It is possible to spread detergent on areas far from the user.

**• Low pressure detergent suction:**

Chemical product (that is not flowing though the pump, but is vacuumed with a VENTURI effect) are supplied lowering the operating pressure of the machine. It is possible to supply detergent with a wide conic jet on areas near to the user.

DETERGENT**• Detergent tank:**

The machine has an integrated detergent tank. It is not necessary to have other external tanks that reduce movements.

DETERGENT**• Double detergent tank:**

The machine has two integrated detergent tanks, to supply two different chemical products with a double selector. It is not necessary to empty the tank if another chemical product is needed. It is not necessary to have other external tanks that reduce movements.

**• Pressure accumulator:**

The release of the gun trigger produces a strong counterstroke in the pump. This device amortizes this power with great benefit for the pump components and for the user, because it removes all the vibrations.

**• Gearbox rpm reducer:**

Endothermic motor has a high rotation speed (from 3000 to 3400 RPM), so the RPM reducer is applied to lower the rotation of the connected pump. Low rotation speed of the components grant longer pump life.

**• Pressure gauge:**

It allows the visual control of the machine operating pressure.

**• Adjustable pressure:**

It is possible to lower the pressure for gentle uses and for water saving.

The hot water high-pressure cleaner is the best tool for tough or non water-soluble dirt removal.

Suitable for different uses and ideal in several sectors like agriculture, food industry and primary and secondary building.

Excellent for machines washing like: tools, engines, farm tractors and means of transport (oily dirt); removal or animal and vegetable residuals (stables and food industry), washing of heavy building equipments (cement mixers, cranes, earth-moving equipments etc.). In the food industry has a perfect hygienising effect.

Why a hot water high-pressure cleaner?

It is necessary the use of a hot water high-pressure cleaner whenever it is necessary to degrease oily or particularly tough dirt in the shortest time possible. Washing efficiency of hot water is much higher than the cold water one (up to 50% higher on some kind of dirt), because heat assists dirt degrease. Heat effect on the surface produce also fast drying. With the use of a hot water high-pressure cleaner it is possible to have: shorter washing time (under the same kind of dirt), better degrease of non water-soluble dirt, shorter drying time and less quantity of chemical product used: in few words, lower cleaning fixed costs.

The boiler

It is a gas oil heater that raises water temperature coming out of the pump; the difference between inlet and outlet water temperature is technically indicated like DeltaT.

Boiler dimensions, in other words coil and gas oil consumption, determine the thermal power of the burner.

Under the same conditions, increasing the delivery rate (quantity of water to be heated) the Delta T decreases proportionally. It is easy to understand why high pressure cleaners with higher delivery rates have more powerful burners: to grant the best operating temperature in each working condition. All our boilers have thermal output very high, near 90% or higher. This means that the relation between usable obtained power (Delta T impressed in water) and power consumption (gas oil) to produce that power is very high.

What changes among high-pressure cleaners with similar performances?

It is necessary to consider besides pressure and delivery rate also the standard equipment (dimensions and type), optional functions (antscale, total stop, etc.) and the manufacturing specifications (type of materials and applied technology). Nevertheless the most important aspect is the resistance to wear and tear and to continuous use, that raises progressively with the increase of manufacturing components specifications or moving up from a model to the next class one.

WOBBLE PLATE

• Axial pump:

The movement of the (3) pistons occur through the rotation of an inclined wobble plate (advancement) and springs (return). The longitudinal axles of the pistons (placed at 120° each other) is coaxial to the motor rotation axle. Simple manufacture, there are few moving elements.

CRANKSHAFT

• Linear pump:

The movement of the (3) pistons occur through a system of connecting rods and crankshaft. The longitudinal axle of the pistons (placed at the same level or linear) is perpendicular to the motor rotation axle. It is more versatile to bear high delivery rates (from 21 l/min) and it has a better self priming.

WATER COOLING
• Water cooled motor:

Water flows through the S/S coil around the motor, this allows a better thermal exchange (and so a cooling) than air also in those countries where inlet water could reaches 60°C. This allows a drop in operating temperature of the motor and pump mechanical elements, granting a better reliability and longer life.

T.S. Total Stop
• Total Stop:

Releasing the gun trigger the pump stops automatically avoiding element damages during the by-pass phase. Pulling the trigger, the high-pressure cleaner starts automatically. Max pump protection.

T.S. Total Stop 24V
• Low voltage and delayed Total Stop:

To avoid quick and multiple start and shut down of the motor/pump group whenever the gun trigger is pulled and released, this disposal delays of about 15 seconds the machine shut down. Prevention, energy saving, top safety and pump longer life.

T.S. Total Stop 24V
• Low voltage and delayed Total Stop with intelligent shut down:

To avoid quick and multiple start and shut down of the motor/pump group whenever the gun trigger is pulled and released, this disposal delays of about 15 seconds the machine shut down. In case the machine is unused for more than 20 minutes or there are leakages in the pressure circuit, the machine shuts down automatically and completely: control panel power cut-off. Prevention, energy saving, top safety and pump longer life.

• Motor low rotation speed:

The electric motor transfers the same number of revolutions to the pump. With a 4 poles motor there is a lower rotation speed of the components (1400 RPM in case of 50Hz or 1750 RPM in case of 60 Hz) granting longer pump life. Extending lifetime solution.

• High-pressure detergent suction:

Chemical products (flowing though the pump) are supplied at the same operating pressure of the machine. It is possible to spread detergent on areas far from the user.

• Low pressure detergent suction:

Chemical products (that is not flowing though the pump, but is vacuumed with a VENTURI effect) are supplied lowering the operating pressure of the machine. It is possible to supply detergent with a wide conic jet on areas near to the user.

• Pressure accumulator:

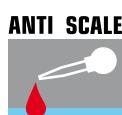

The release of the gun trigger produces a strong counterstroke in the pump. This device amortizes this power with great benefit for the pump components and for the user, because it removes all the vibrations.

• Pressure gauge:

It allows the visual control of the machine operating pressure.

• Adjustable pressure:

It is possible to lower the pressure for gentle uses and for water saving.

• CHEMICAL ANTISCALE DEVICE:

The machine is equipped with an integrated tank to supply the antiscalant product inside the header tank that brings water into the pump. This device (without electronic elements) protects the coil from scale formation; the use of the chemical product inside the circuit is the only efficient solution against scale.

• DOUBLE PIPE GASOIL PUMP:

It makes the gasoil flowing back to the tank, avoiding the gasoil flowing inside the pump during by-pass phase (single tube pump operation): this allows to obtain low temperatures inside the pump avoiding greasy deposit formation that would block the pump.

• LOW FUEL LAMP:

LED flashing, connected to a level probe, indicates lack of gasoil inside the tank. It shuts down the burner avoiding dry operation of the gasoil pump.

VULCANO 74

- Vertical burner with high thermal efficiency steel coil.
- You can get hot water still if not in pressure due to flow switch presence.

**Optional:**

4.618.0012
 high pressure hose 3/8" ø 5/16" 10m, to connect any cold high pressure cleaner to the Vulcano.

**VULCANO 74**

Code	8.699.0015
operat. pressure allowed	200 bar
operat. pressure allowed	2900 psi
delivery rate allowed	1260 l/h
delivery rate allowed	5.55 GPM
abs. power/voltage	300W - 230V~50Hz
diesel tank	18 l./4.8 gal
max temp. inlet/outlet	40 °C / 140°C
fuel consumption	5,6 l/h - 1.5 gal/h
heat output	74 kW
machine dimensions	94x65x90 cm
machine weight	44 Kg / 88 lbs

MISSISSIPPI

Standard equipment:

- Gun with rotating coupling.
- Lance with nozzle-holder.
- Power cable 5 m
- High pressure hose 8 m

- Vertical burner with high thermal efficiency steel coil.
- Diesel pump with by-pass valve.

Optional:

- Available other accessories (see Accessoires pages).

**Have more time for
yourself**

Lavorwash presents the Hyper range.
This is a complete series developed specifically for
specialists.
Maximum reliability, thanks to the best available
technology and components used.
No worries working continuously at top
performances.

HyperL GUARANTEED

Hyper L (single phase)

Impact and weather
resistant, single piece
polypropylene cover

- Vertical burner with high thermal efficiency steel coil.
- Safety valve.

- Auxiliary motor for burner air cooling and mechanical two ways fuel pump.

- Temperature regulation gauge with high sensitive stainless steel sensor.
- Low fuel lamp and cut-off

- Hose-reel with brake (hose not included) cod. 3 697 0011

Standard equipment:

- Gun with rotating coupling.
 - Lance with nozzle-holder.
 - Power cable 5 m
 - High pressure hose 10 m

*= in combination with gun cod. 3.700.0025

S/S prolonged adjustable probe
Ø 21 for sand-blasting.

Sand-blasting head** nozzle
G1/4" max. 400 bar with internal
tungsten carbide conveyor.

FOR EACH MODELS

- 3.749.0207 sand-blasting head nozzle max. 400 bar
- 3.749.0208 round sand-blasting head nozzle max. 400 bar
- 3.749.0209 extended sand-blasting head nozzle max. 400 bar
- 3.749.0210 S/S prolonged adjustable probe

**** Sand-blasting heads are not supplied with nozzles.**
Use them in combination with:
code 3.749.0432 - 15050 nozzle
code 3.749.0433 - 15045 nozzle
code 3.749.0434 - 15040 nozzle

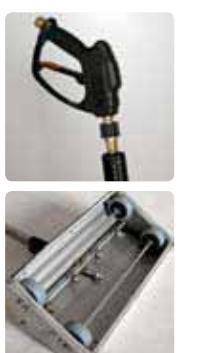

for Magnum 3317 LP - Thermic 13H and Thermic 17 HW
in combination with M24 nipple cod. 3.749.0320

Motorized head

- S/S motorized head for case and tank cleaning
- Complete orbital internal coverage
- Complete with nozzles and converter

Motorized head

Code	3.749.0196
operat. pressure	220 bar - 3190 psi
allowed pressure	250 bar - 3625 psi
operat. delivery rate	1260 l/h - 5,56 GPM
nominal temperature	90° C
min. diameter	Ø 40 mm
nozzle type	2 x M4

for Magnum 3317 LP - Thermic 13H and Thermic 17 HW
in combination with M24 nipple cod. 3.749.0320

Floor Cleaning Lance

- S/S floor cleaning lance (nozzle not included)
- Complete with RL 35 gun
- For washing terraces and external floors in general.

Floor Cleaning Lance

Code	6.602.0020
operat. pressure	250 bar - 3625 psi
allowed pressure	280 bar - 4060 psi
operat. delivery rate	1200 l/h - 5,3 GPM
nominal temperature	160° C
nozzle dimension	.060

for Magnum 3317 LP - Thermic 13H and Thermic 17 HW
in combination with M24 nipple cod. 3.749.0320

Rotary Floor Cleaning Lance

- S/S floor cleaning lance
- For washing terraces and external floors in general
- Self stirring head with two rotating nozzles (nozzles not included).

Rotary Floor Cleaning Lance

Code	3.749.0188
operat. pressure	250 bar - 3625 psi
allowed pressure	280 bar - 4060 psi
operat. delivery rate	2400 l/h - 10,59 GPM
nominal temperature	80° C
nozzle type	1/4 Npt M

Rotary nozzle* G1/4" F with S/S body and seat/nozzle in highly shock-resistant tungsten carbide

* 1/4" M/M 24 Extension set for rotary nozzle:

codes 3.749.0320 + 3.749.0004

Power, air suction, depression: which technical data is most important?

The right technical data of a vacuum cleaner is the vacuum efficiency, that is the mix of different values, i.e. air suction, motor power and depression. Air suction is the vacuumed air volume, commonly expressed in litres per seconds (l/sec) and it is the result of the average air speed multiplied by hose diameter. The depression is the vacuum power (it can be defined as the vacuum power to collect dirt) and it is commonly expressed in kPa or in mbar. It is an inverse relation to air suction: the narrower the flex diameter, the least

vacuumed air volume but the best strength to pick up dirt.

Power motor is expressed in Watt and it is not proportional to vacuum efficiency!

If the vacuum cleaner is not well-done, it wastes a lot of electric power without having the best performances possible. Summing up, the vacuum cleaner efficiency is a relationship between air suction (resulting in multiplication of pressure and air suction) and motor power. All our vacuum cleaners have a top efficiency and are manufactured considering essence and user's benefit.

Fixed or tilting trolley, which one to choose?

The choice of the trolley must be made considering the type of use needed. Generally, tilting trolley is much more useful to collect dust and solids, because the tilting tank make it easier the emptying or pouring. The fixed trolley is better for liquids vacuuming, because it is equipped with drain hose system, emptying is fast and step by step, avoiding the effort of lifting the tank.

What kind of tank material is to be preferred?

Our vacuum cleaner range includes plastic tanks (polypropylene or PP) or stainless steel tanks. The PP tank is flexible, shock proof and resistant to chemical

products. It is recommended for frequent moving uses or vacuuming of particularly aggressive chemicals (for example in combination with a single disc machine). The stainless steel tank is more rigid, steadier, resistant to mechanical abrasion and it is aesthetically agreeable. It is recommended for static use, with abrasive materials or in a public place.

What safety vacuum cleaners are?

Safety vacuuming means that the product is entirely certificated (not the filter only, but the entire machine) in order to comply with the strictest directives and European rules that regulate vacuuming of dust dangerous for health, divided into two groups: hazardous dust and explosives ones. Hazardous dust are also divided in: dust with OEL* value and cancerogenous dust (asbestos is considered a cancerogenous dust only in Germany and it needs another classification and certification). An example of this dust is asbestos, food or wood preservatives and fertilizers.

Explosive dust is for example wood dust, aluminium dust and flour.

Number of motors:

It explains how many motors there are in the vacuum cleaner.

Ignition is independent in order to increase progressively the performances.

The working system (whenever it is more than one) is in parallel, so the air suction increases and the depression is steady whenever the motors are progressively switched on.

Anti electrostatic current device

Dust rubbing at high speed against vacuum cleaner walls creates a magnetic field that neutralizes on the user with small and annoying discharges also through plastic material. This certified system removes this phenomenon on the machine, granting best comfort and safety for the user.

Paper collector filter

Allows filtering and collection (with a valve) of rough dirt without dirty the tank whenever it is time to replace it.

It is useful for dry waste, also in combination of other thinner filters.

Cloth filter

The cloth consistency and its shape allow a simple cleaning phase and the re-usage of the filter.

It can be used only for vacuuming dry waste; if combined with nylon filter it is possible to work for a longer period of time.

Cartridge filter

The continuous folders arranged in circle allow a higher filtering surface in a smaller area.

More cleaning autonomy with a thin filtering action. It can be used only for vacuuming dry waste and it is reusable.

HEPA filter

High Efficiency Particulate Arrestance. Hepa filter is 99,97% efficient until 0,3 micron impurities.

Multipurpose washable filter

It combines all the advantages of the cartridge filter but with the plus that it can vacuum both dry and wet at the same time. It can be washed with tap water.

Filter shaker

It clears filter from dust without touching it or opening the vacuum cleaner; the vacuum efficiency is kept at max.

AUTOMATIC ON/OFF

Power tool socket

The presence of the socket on the vacuum cleaner allows the connection of any power tools (that generally produces dust).

The vacuum cleaner switches on and off automatically with the use or switching off of the connected power tool. The vacuum switching off function, is delayed to collect remaining dirt in the hoses.

Max productivity, energy saving and easy use.

M Class certificate for vacuum cleaner

It is the ability of the vacuum cleaner to keep (through the filtering system and the manufacturing specifications of the vacuum cleaner) the 99,9% of all vacuumed dust with OEL (Occupational Exposure Limit) higher than a 0,1 mg/m³.

Some example of the dusts that can be kept with these vacuum cleaners are working residuals of: wood, copper, insecticide and pesticide, manganese (tools of the earth-moving equipments), platinum, nickel etc.

H Class certificate for vacuum cleaner

It is the ability of the vacuum cleaner to keep (through the filtering system and the manufacturing specifications of the vacuum cleaner) the 99,995% of all vacuumed dust with OEL (Occupational Exposure Limit) higher than a 0,005 mg/m³. Some example of the dusts that can be kept with these vacuum cleaners are working residuals of: asbestos (only in Germany a specific certificate is necessary), lead, bacteria/moulds/germs (they can be found in the hospital renovation), cadmium (accumulators and anti-rust), chromate potassium (matches, pencils, wood impregnate, printer ink, etc.)

***OEL** (Occupational Exposure Limit) is a value (expressed in mg/m³) that specifies the max concentration of dust in the working area that doesn't cause injuries to people. The lower the OEL value, the more dangerous the dust is.

Nomenclature

Multipurpose washable filters

Filters used until today could be used for dry vacuum only, and needed to be removed for wet vacuuming (after tank cleaning), and vice versa. On the opposite, with the multipurpose filter you can vacuum dry and wet at the same time, without taking the filter off or cleaning the tank. It is enough to empty the tank and rinse the filter at the end, without changing it.

**Number of motors:**

It explains how many motors there are in the vacuum cleaner.

Ignition is independent in order to increase progressively the performances.

The working system (whenever it is more than one) is in parallel, so the air suction increases and the depression is steady whenever the motors are progressively switched on.

ELECTROSTATIC**Anti electrostatic current device**

Dust rubbing at high speed against vacuum cleaner walls creates a magnetic field that neutralizes on the user with small and annoying discharges also through plastic material. This certified system removes this phenomenon on the machine, granting best comfort and safety for the user.

**Paper collector filter**

Allows filtering and collection (with a valve) of rough dirt without dirty the tank whenever it is time to replace it.

It is useful for dry waste, also in combination of other thinner filters.

**Cloth filter**

The cloth consistency and its shape allow a simple cleaning phase and the re-usage of the filter.

It can be used only for vacuuming dry waste; if combined with nylon filter it is possible to work for a longer period of time.

**Cartridge filter**

The continuous folders arranged in circle allow a higher filtering surface in a smaller area.

More cleaning autonomy with a thin filtering action. It can be used only for vacuuming dry waste and it is reusable.

**HEPA filter**

High Efficiency Particulate Arrestance. Hepa filter is 99,97% efficient until 0,3 micron impurities.

**Multipurpose washable filter**

It combines all the advantages of the cartridge filter but with the plus that it can vacuum both dry and wet at the same time. It can be washed with tap water.

**Filter shaker**

It clears filter from dust without touching it or opening the vacuum cleaner; the vacuum efficiency is kept at max.

AUTOMATIC ON/OFF**Power tool socket**

The presence of the socket on the vacuum cleaner allows the connection of any power tools (that generally produces dust).

The vacuum cleaner switches on and off automatically with the use or switching off of the connected power tool. The vacuum switching off function, is delayed to collect remaining dirt in the hoses.

Max productivity, energy saving and easy use.

***OEL** (Occupational Exposure Limit) is a value (expressed in mg/m³) that specifies the max concentration of dust in the working area that doesn't cause injuries to people. The lower the OEL value, the more dangerous the dust is.

**120
Volts**

When working conditions and dirt type are extreme, dangerous or difficult to manage, then the VLP range is the solution to all the problems. Innovative filtering systems, liquid waste management, toughness construction and (for some models) the possibility to work with dangerous dusts, set new standards in the industrial sector regarding extensive working expectation, productivity, filtering capacity and efficiency.

Why wider filtering area is not making automatically a better machine?

In the industrial sector, productivity, resistance and breakeven expectations are growing.

The ideal vacuum would be then a machine filtering any kind of dust (also the thinnest) being able to work continuously without the need to clean the filter and without any maintenance.

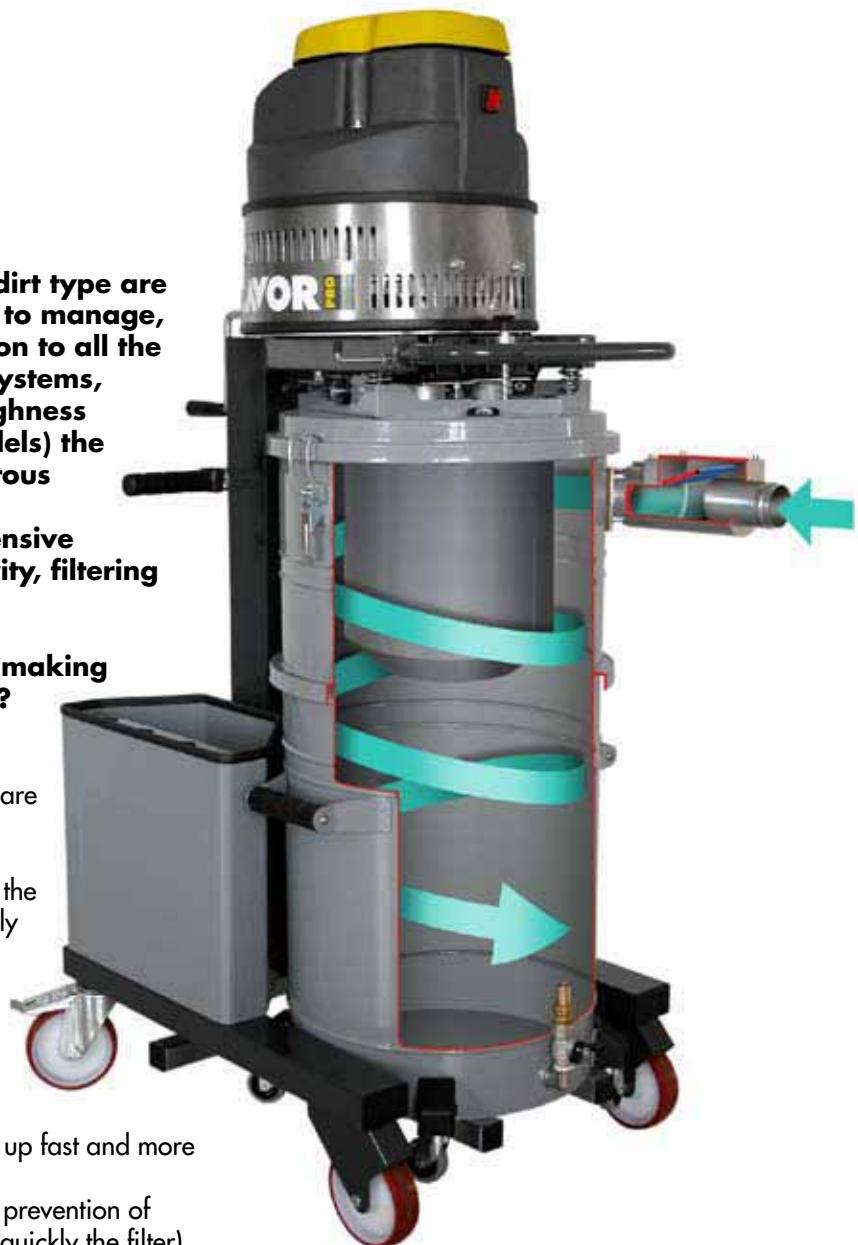

It is more important to get close effectively to this target rather than the way we can reach this. This is the reason why is useless having a big filtering area if the filter is still clogging up fast and more often I need to stop working to clean it.

In our machines we developed the best prevention of the problem (avoiding dust is reaching quickly the filter) rather than trying a solution afterwards (since the filter is clogging up quickly, extending the filtering area it is supposed to extend the effectiveness). It doesn't matter how wide is the filter, but for how long can work the machine without the need to clean the filter... And with this issue, we are the best.

When either more airflow or more depression is necessary?

The airflow helps the dirt transport through long pipes. Longer is the hose, better is bigger airflow; still with light dust it is better having lower depression: the inlet air speed will be lower, the harder the dirt is getting in touch with the filter.

When residuals have high specific weight, depression is more important than airflow to win gravity force of dirt attached to the surface.

What are safety vacuums?

A safety vacuum cleaner is intended a machine entirely certified (so not only the filter, but the whole machine) to comply hard EU directives and norms regulating vacuuming hazardous dust split in two big groups as dangerous dust and explosive dust.

Dangerous dust is split again in: dust with OEL* value and cancerogenic dust (only in Germany asbestos is considered a cancerogenic dust for which a further classification and certificate is necessary).

Some examples of these dust are asbestos, food and wood preservatives and fertilizer.

Explosive dust are for example wood dust, aluminium dust and flour.

Cyclonic vacuuming system (international copyright)

Dust is getting in tangentially inside the filtration chamber and starts turning around fast due to centrifugal and gravity force, the dirt falls down screwing into the container without reaching the centre.

In order to delay the contact between the dust with the filter, there is a cylindrical protection (that covers it completely) with holes on the top. In the inner completely open bottom area, the air speed coming up to the filter is very low.

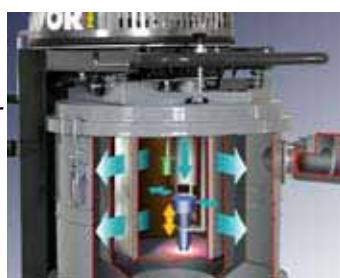

The proof of the effectiveness of this system is the remaining cake in the tank completely flat: there is no sensible vacuuming at the centre while in other machines an inverted cone cake shaped is produced due to dust coming back up to the filter sucking it quickly.

Incredible extensive working sessions still with thin dust without cleaning the filter.

Pneumatic filter shaker (international copyright)

Through the selector, the airflow is inverted to feed an internal pneumatic hammer that shakes and blows the filter, cleaning it again completely. It is not necessary to touch the filter or worst to clean it outside the machine spreading again dust everywhere.

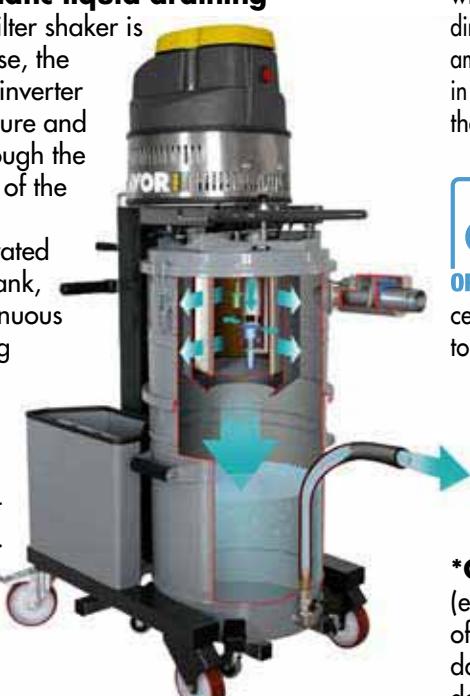

Automatic liquid draining

When filter shaker is not in use, the airflow inverter put the tank in pressure and push liquids out through the faucet at the bottom of the tank.

With optional integrated submersible pump tank, the draining is continuous and without stopping working.

With this accessory it is possible to push out completely also melting residual that pump won't pick up.

Antistatic machines and accessories

Using specific conductive materials and engineering, there's the prevention of ignition sparks from the machine side, up to the end of any tool available for this machine range.

ATEX (ATmospheres EXplosibles) vacuum certificate

Machine can safely working in areas (ATEX zone 2 or 22) where potential explosive atmosphere are present. The classification of the areas where machine will be installed accordingly with EU directives and amendments is in charge to the user. Important: this certificate allows only to install the machine and not to pick up potential explosive dust for which a TYPE 22 certified product is mandatory.

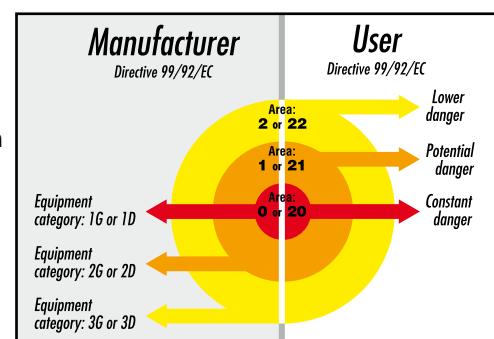

TYPE 22 vacuum certificate

All the machine (not only portion or just the filter) is complying EU directive and norms that describe applications and working conditions.

Talking about TYPE 22 means machine is complying together ATEX directive for zone 22 and EU directive to be able to work with dangerous dust (M class): further to free installation of the machine in an area where is not frequent but possible the presence of explosive atmosphere, it is allowed to pick up

potential explosive air/dust mixture. The classification of the areas where machine will be installed accordingly with EU directives and amendments is in charge to the user.

Compressed air operating vacuum

Only compressed air is necessary to make the machine working. Not using any electric component, it is possible to offer an ATEX self certificate for ATEX zone 2 or 22. This is a good cheaper option to electric ATEX machines.

***OEL (Occupational Exposure Limit)** it is a value (expressed in mg/m³) that tells the maximum concentration of dust in the working area when extended exposure is not dangerous for the operator. Lower is the OEL value, more dangerous is the dust.

DTX Ex Type 22

Standard Accessories:

- Double filters

- Depressure gauge
- Silenced Motors.

- Automatic filter shaker

- Tough integrated accessory storage facility
- Non-overturning steel structure.

Optional:

ATEX - TYPE 22

Type 22**

Standard Accessories:

- 1 µm duster filter

- Collector tank lifting lever
- Non-overturning steel structure.

- Collector tank lifting lever

- Compressed air inlet with pressure regulator

Optional:

- It is necessary to use supply conductive flexible hose (compressed air) code 0.144.0048, in order to comply with ATEX directives.

ATEX - TYPE 22

Which are key components in a single disc machine?

The procedure to choose the right product for specific application must take into consideration of: the weight (that is the pressure over the brush), the surface to work, the RPM / type of construction of the motor and the transmission type. Generally speaking, the lower is the rotation speed, the most effective is the pressure over the brush and deeper is dirt removal.

With the increasing of rotation speed, lower is the effect of the pressure over the floor.

Different accessories combinations, rotation speed and motor power can provide the solution for any application: from dewaxing or deep scrub, up to polishing or buffing; from the crystallization up to spray cleaning; also carpet cleaning or sanding. Please see application chapter on the next pages.

How much power is necessary?

There is not a set rule, if not the common sense: higher is the friction over the floor (a combination of type of working, type of surface and type of accessory used), the higher will be the power request to the motor. So more powerful is the motor, the harder the job being able to be done.

The power is nothing without a control....

Together with its construction simplicity there are the worst danger for the operator who has to control the machine for long working sessions.

Only the perfect components and weights distribution on the machine allows a perfect balanced and ergonomic working posture, without any vibration and any strange effort to keep it in place.

A cheap construction (less strength) not considering the perfect ergonomic for the user, further to the waste of money (less productivity), it's a serious danger for the health!

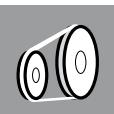

- **Satellite planetary gearbox transmission:**

Up to 400 RPM the reduction and transmission system is made with satellite planetary gear.

Grants continuous power, long life and noiselessness of the machine.

- **Belt transmission:**

When the rotation speed is more than 1000 RPM, the necessary traction torque decreases and technically it is a better solution because it damps the vibration of the rotary motion; assembling procedure and maintenance are easier.

- **Brush speed:**

Means Rotation Per Minute of the brush.

- **Vacuum system:**

Working at very high speed, a very fine dust is produced on the floor; it is collected in a collector tank, avoiding spreading in surrounding areas.

- **Pressure regulator:**

In order to obtain the best effect, it is possible to regulate the brush pressure on the floor.

Nomenclature

SDM = Single Disc Machine

RPM brush (1/10)

SDM 35 G 18-55

Scrubbing width

W motor (1/10)

Transmission: G = gearbox / B = belt

SDM 35 G

188 RPM

Accessories and brushes are not included. For available accessories refer to accessories pages.

- Wet-scrubbing and stripping.
- Easy to handle, practical and light. Thanks to the reduced dimensions and weight, it is ideal to use in small and average spaces or congested areas, without any limitation on a standard professional task, due to the lightness is suitable also for women use.

- Transmission: satellite planetary gearbox

- Strong handle joint

Optional:

0.955.001 Detergent tank
0.955.002 Spray system

○ = optional ● = available

Direct experience of professional people has resulted in Lavor PRO floor scrubbers range: easy to handle, powerful, efficient, carefully conceived and designed by using top-quality materials.

Why cilindric brush?

High speed rotation for a polishing effect; great dirt degrease in floors with grout ; possibility to link together the sweeping function; the rotation direction assists forwarding in models without traction.

Why disc brush?

Extended mechanical action of the bristles on the floor, ideal for persistent dirt: the special setting of the brush plate allows a balanced gripping effect, assisting easy use in the non traction models. Complete cleaning also next to walls is possible and the compact washing element lower at the sides is studied to scrub also under edges.

How a squeegee should be designed?

The shape and the material used grant a perfect drying in every condition, also on floors with grout or when quick U turns are necessary.

The floating body can stay in the machine operating space (compact / room saving)

The manual adjusting system grants a perfect drying on each kind of floors.

How long do battery charges last?

It is impossible to determine exactly how long a battery charge lasts and so how long a machine can work in autonomy.

Battery autonomy changes depending on type of surface, dirt quantity, brush type and way in which traction system is used (speed and slope).

Battery life is made up of number of charge cycles (also incomplete), if use conditions, charge and service are perfectly observed.

Manufacturing technology diversifies numbers of cycles, service needed, use/charge conditions and performances.

• Number of disc brushes:

The scrubbing group meets different cleaning path need with 1, 2 or 3 disc brushes.

• Number of cilindric brushes:

Scrubbing group offer 1 or 2 roller brush solutions together with the sweeping capability.

Bristles of different material allows perfect cleaning in any conditions, (carpet and parquet included).

• Disk brush quick connection and release: This system allows the automatic connection of the disc brush and a quick release toolless.

• Cilindric brush quick connection and release: The fittings and releasing of brushes is toolless. Ordinary cleaning maintenance are simple and quick for anybody.

• Constant brush pressure:

The pressure of brushes on the floor is made by the heavy brush plate that follows irregularity on the floor and gives always the top pressure without any adjustment still with shorter bristles.

• Equal cleaning:

Our two discs scrubbing groups have a belt (and reduction gear with a quick release elastic joint) transmission that further to prevent vibrations, they grant the same brush rotation speed (so the same cleaning effect on the two sides) in any dirt or floor condition.

**STOP**

• Solenoid valve:

Together with the reliable mechanical solution faucet, this system reduce chemical consumption and avoid solution waste. The flow is open only when brush is working, there is no accidental leak with machine stopped. The system is protected by a filter with easy maintenance.

• Vacuum motor protection

To avoid dampness problem in the collection tank, our scrubber dryers have: antifoam devices, filters, decantation rooms, and liquids level sensors (stopping the machine when the higher limit is reached). All these precautions grant the best efficiency and components longer life.

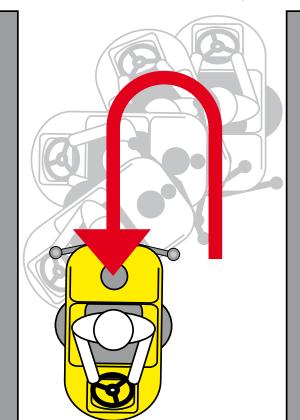

• U-turns in closed area

The space (length X width) needed to make a U-turn is the min. width in which it is possible to work with the machine. The smaller this room is, the higher

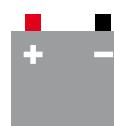

the machine output, because less maneuvering is needed.

The technical features of our floor scrubber driers (the front wheel shaft is close to the rear one in the walk behind models and the tight steering radius of ride-on ones) grant the minimum room for U-turns. On each ride-on models there is an automatic device that lowers speed when turning, raising the safety level also for inexperienced users.

• Integrated battery charger

Some models are equipped with integrated battery charger, other ones have the predisposition only. It is possible to charge batteries in different rooms, without coming back to the same place.

• Integrated battery

Standard integrated battery is built with a maintenance free technology and it does not require restrictions about the place for battery charging. The non stop research allow to use always up-to-date batteries that combined with appropriate battery charger grant machine top performances.

• Hour meter

Useful to check work sessions and to plan stops for battery charging. Best output and investment protection.

• Charge meter and battery protection

It informs when the autonomy is finishing, allowing the end of the cleaning task (stopping brushes first and then the rest). It prevents damages to the batteries, preventing the complete discharge with any kind of technologies.

Standard accessories:

PP brushes

Squeegee strip

- Detergent solution tank with large opening protected by quick locking cap.

- User friendly control panel
- Detergent solution regulator
- Automatic device for squeegee lifting while reverse going.

- Easy access to electrical components.
- 3 wheel-drives for tight steering radius.

Optional:

Brushes

Pad holder

Pad

Tube batteries
Gel batteries

0.108.0003
Battery charger + Smartcard

Battery charger:

Battery chargers are supplied already preset if requested together with batteries.

If the charger is ordered alone, it is necessary to specify the setting desired.

Before first recharging procedure is always important to check the proper setting of the charger.

SMARTCARD:

Ideal for users that use one battery charger for both wet (tube plate) and GEL batteries. Inserted into the battery charger, they set automatically proper battery recharge curve (vital function for performances and battery life).

Is it better a petrol engine driven or a battery powered model?

The use of a petrol engine implies the presence of exhaust gasses and therefore the machine must be used only in outside areas or in areas where the operator is not exposed at such risk. The battery models can be used also inside. From the technical and qualitative point of view the sweepers do exactly the same cleaning task, but the petrol engine machine can work nonstop (it is only necessary to fill up the tank with petrol), while the electric models, once the battery is empty, need to be re-charged (an average of 8-10 hours of charge, if battery is completely worn-out)

How should the brush be?

In the sweepers, there are two types of bushes: the first one rotates with a perpendicular axle to the floor (this is the one called "side brush"), it is useful to move dirt into the collecting area and to reach dirt near borders or under edges; the second one rotates with a parallel axle to the floor (this is the one called "main brush"); it rotates counterclockwise (opposite) to the forward direction of machine and collects dirt into the collection tank. The brushes differ in the shape (round flat the "side brush" and cylindrical the "main brush"), in the type of bristles (the way bristles are arranged on the brush body), in the body material (that accordingly to options, provides resistance still in humid environment or competitive construction) and in the bristle material /diameter/ shape.

Generally, the stiffer and rougher the bristles are, the better they collect the heaviest dirt adherent to the floor (typically wet leaves). The more flexible and thinner the bristles are, the better they collect light and thin dirt. To have a better scraping action, it is necessary to add steel bristle to the PPL ones. To collect very thin dirt, it is necessary to use only short round PPL bristles. As a consequence of motorization (petrol engine or electric one) and so of indoor or outdoor use, the walk behind models have stiffer or softer bristles, to adapt in best way possible to the type of dirt typically found in the working area.

How long do battery charges last?

It is impossible to determine exactly how long a battery charge lasts.

Battery autonomy changes depending on type of surface, dirt quantity, brush type and way in which traction system is used (speed and slope). Battery life is made up of number of charge cycles (also incomplete), if use conditions, charge and service are perfectly observed.

Manufacturing technology diversifies numbers of cycles, service needed, use/charge conditions and performances.

Which kind of battery technology?

Batteries have different prices and so it is important to know their features in order to choose the best one as far as the operator's needs or habits are concerned.

They divide into two families according to the necessity of recurrent acid solution refilling.

Acid lead batteries (Pb-Acid), need refilling, because during the charge cycle a lot of gasses are generated (for this reason a specific and aired room is necessary for safe working) and the solution vaporizes: it is necessary to add distilled water before the submerged lead parts that are no more covered with water begin to oxidize (compromised efficiency).

VRLA batteries (Valve Regulated Lead Acid) are airtight, this means that gasses generated during the charge cycle are rearranged inside the battery: refilling is not necessary, it is possible to charge them in any room and they can be carried without risk.

Acid lead batteries divide themselves into categories depending on the thickness of plate they are built of: if the plate is plane, the resistance to discharge is lower and few charge cycles are necessary, if the plate is tubular (or armed, recognizable opening the battery cap and verifying that the plate is made up of a lot of cylinders side by side instead of a thin leaf sheet) there is a higher resistance to discharge and to charge cycles.

VRLA batteries divide themselves depending on the condition (liquid or gel) of the acid solution (that enables energy exchange) and on the way it is kept inside the battery: if it is liquid and kept by a spongy and filamentous material, the battery is called AGM; if it is a gel solution inside a membrane, the battery is called GEL battery. On the market there are a lot of products completely different in features and value and it is very important to know the manufacturing details to couple the right battery charger (it is not sure that any battery charger is suited and get a better result than the ones in our range that are specific for our batteries) and to come up to the working expectations.

Whatever technology may be it is important to know that batteries have a common effect of self discharge (different for each type of manufacturing technology) and so it is important a recurrent charge (each three months approximately) if they are unused for long periods of time. Batteries suffer from incomplete charge cycle (except "pure lead" technology) and so it is necessary to charge them at the end of the working day (our battery charger is going to supply only the necessary energy and the charge cycle is going to finish earlier). It is also important not to cut off the charge before the battery charger has finished the cycle (green light). Respecting these simple rules, the best result and the best machine output will be obtained.

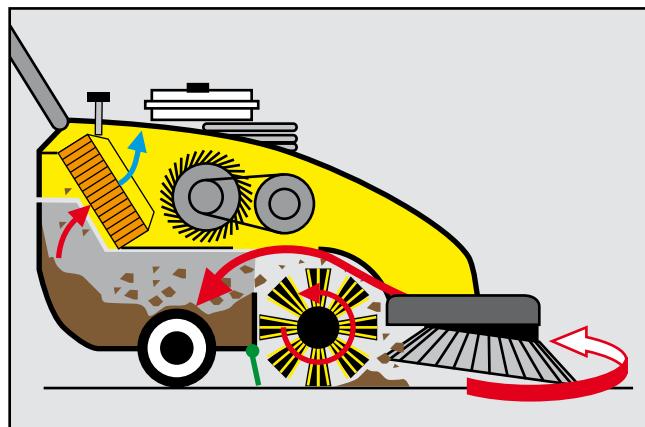

• Direct front collection

Waste is conveyed with a small push in the front part of the machine. It allows the collection of heavy waste but limiting dustraising.

• Indirect back collection

Waste is conveyed, rotating on the main brush, into the back part of the machine; this allows an optimization of the collection capacity because the complete volume of the tank is used. The machine is easy to handle because the weight is balanced on the wheel back axis.

• Quick brush release

The system allows a fast brush replacing, an easy/fast service and easy access to driving elements

• Belt drive

The circular section grants a high resistance, stillness, reliability and it doesn't need service.

• Side brush exclusion

It is a system protecting bristles during machine stop or whenever it is not necessary to use it.

• Dust vacuum system

It can be found in the main brush area. Together with the mechanical action, it conveys waste and dust that are collected into the tank through the right filters supplied.

• Front dust vacuum system

As well as traditional vacuum system, a vacuum system can be found in the lateral brush/es collection area.

Dust dispersion outside the machine is limited also before the main collection area is reached.

• Antistatic device

Dust rubbing at high speed against sweeper metal parts creates a magnetic field that neutralizes on the user with small and annoying discharges also through plastic material. This certified system removes this phenomenon on the machine, granting best comfort and safety for the user.

• Flap raise system

The main brush collection area is delimited by protections (flaps) touching the ground, better vacuum effect. With a big residual is possible to raise the flap collecting it rather than keep going pushing it on the floor

• Filter shaker

It clears filter from dust without touching it or opening the sweeper; the vacuum efficiency is kept at max. In the ride-on models this device is electric, granting the best comfort and output for the user.

GV is suitable to degrease and sanitise any object or surface in an easy, ecological and definitive way .

GV range is made up of electric generators producing saturated steam at 10 atm pressure and 180°C temperature.

It is ideal for food and baking industry, for private and institutional use, for pharmaceutical and mechanical industry, for dairy factories, for building sectors and so on.

Performances: temperature, steam production and pressure

The same remarks about pressure and delivery rate made for high-pressure cleaners, have to be taken into consideration also for steam generators; in this case, the important difference is the physical relationship (and so not subjective or debatable) that exists between steam pressure and its temperature: to a fixed pressure values correspond right and univocal temperature. Knowing these values it is easy to identify the ones (like us) who show the right double relation between pressure and temperature.

Outlet steam temperature (not boiler temperature, that is higher) is important because there are natural limits (about 140°C) under which it is not possible to talk about sanitisation and so the purpose that led to the machine purchase (clearly wrong) could be unattended.

Is it better a steam generator or a hot water high-pressure cleaner?

As far as the choice is concerned, the aspects to be considered are the analysis of the task that must be done and all the elements that make up the cost of the operation, i.e. working speed (labour cost) and (more and more important) waste treatment (waste disposal cost).

As far as the working speed is considered, it is important the whole cleaning procedure and not only the effective washing time: with the high-pressure cleaner it is not possible an indoor washing, unless there is a filled in collection system, instead it is necessary to move the washing phase outside; with the steam generator it is not necessary to move outside,

it is possible to wash the part exactly where it is, because the water generated can be easily dried.

Steam at 180°C allow to degrease dirt also without the use of heavy chemical products. If they are necessary to speed up the washing task, it is very important to consider the cost of draining away dirty water.

The danger of chemical products used is generally proportional to the effectiveness against increasing dirt tenacity.

If we wash with the high-pressure cleaner we produce from 10 to 21 litres of polluted water, that must be collected and drained following the current regulation: in a single wash of a couple of hours 2,5 tons of dirty water is produced!

If we wash with a steam generator, the most powerful machine produces 37 litres per hour, with the most part of the liquid that evaporates, with a two hour wash the remaining dampness and disinfecting product is very low! Analyzing all these subjects it is clear that in particular circumstances (lack of purification plant for water treatment), the steam generator is more advantageous of a high-pressure cleaner.

On the other side, rinsing speed is the consequence to the delivery rate that hits dirt, so if only the washing phase is considered, high-pressure cleaner is faster.

Steam can be considered water with a related dampness very, very low (superheated steam is just hot air and it doesn't have a significant mechanical action...), with an outlet temperature much higher (180°C) than a high-pressure cleaner: this means that the mechanical power is lower than the one of water, but the degreasing power of steam is much higher.

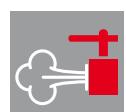

• Temperature regulator:

 The temperature is set-up by an electronic regulator: it allows to obtain damp steam (low temperature) if our application needs a stronger kinetic energy; or saturated steam if the application needs a little water waste on the surface. A lower temperature produces a set lower working pressure accordingly to the steam physic law.

• Steam pressure gauge:

Easily visible on the machine, underlines the different phases inside the boiler: raising, achievement of maximum pressure and working pressure during use..

• Discharge valve:

Allows a complete discharge of the boiler (not possible even through gun use). In this way it is possible to remove water and limestone residual inside the boiler and from the coil surface.

This valve maybe opened only when the boiler is not hot, and it is recommended to accomplish regularly.

• Unlimited autonomy:

The boiler is refilled by a water pump that gets water from an external water tank. This system allows an unlimited autonomy, because it is not necessary to turn off the steam generator and wait a lower temperature to refill with water. An automatic control recharges the boiler when necessary. In some models there is an acoustic signal advising about low water level inside the water tank.

• Detergent:

Thanks to the presence of a secondary tank and pump, we can add chemical product to steam flow, favoring the breakup and the dust removing speed.

It is necessary to use specific chemical product to be mixed with steam and they must not be hazardous when vaporized (recommended: LCB-880DP)

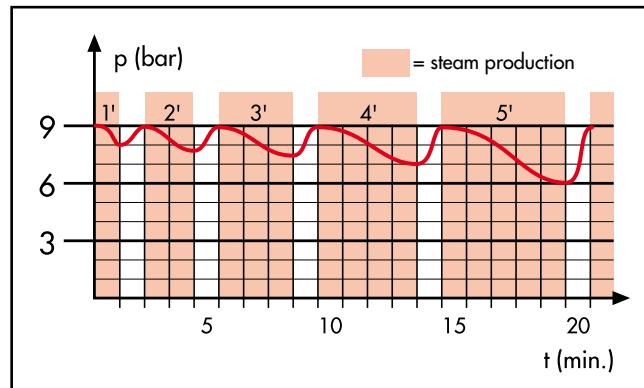

• Integrated vacuum:

Dirt is vacuumed inside a tank integrated in the machine

• Min. granted pressure:

Performances of single phase or vacuuming steam generators, normally, decrease consistently while continuous duty.

With our technology, steam is at 6 bar (158°C) even after 5 minutes of continuous work: performances much higher than any other machine of the same category. After closing the steam gun, steam pressure and temperature return to top values in few seconds

Control panel with low tension controls: ON-OFF main switch, indicator lamp, thermoregulator, water and warning light, gun activating key

*Traceless wheels
suitable for use in food processing area*

Chemical tank
Water tank

S/S AISI 304

Standard accessories:

- Boiler is refilled continuously.
- Heating and activation time required: 7 min.

- Saturated steam at 10 bar at a temperature of 180° C.
- Device for using chemicals and detergents mixed with steam.

Optional:

6.402.0058
m 6 steam gun
with hose

6.402.0063
floor scraping
lance

6.402.0059
m 10 steam gun
with hose

6.402.0064
6 holes
triangular brush
(without small
brushes)

6.402.0067
mm 350 S/S
glass wiper

6.402.0065
7 holes
triangular brush
(without small
brushes)

In order to complete the chemical products supply and to allow a better applicability and effectiveness, the sprayers are the perfect solution when supply wideness, use versatility and dosage saving are taken into consideration.

They are split into three different categories: pre-compression, pneumatic charge and continuous pneumatic charge.

Pre-compression sprayers don't need any separate air compressor, because the integrated manual pump is used to compress the tank and vaporize the product. They work at low pressures, they use plastic materials for easy moving, lightness and perfectly resistant to chemical products, thanks also to FPM seals (Viton).

Pneumatic charge sprayers need to be connected to an air compressor to charge the tank and allow the product vaporization without the connection to the air compressor. They work at high-pressure and so they use spacious steel or stainless steel tanks to allow a greater working autonomy.

Continuous pneumatic foam sprayers need a permanent connection to an air compressor; in this way air mixes with the chemical product producing a soft and voluminous foam that persists on surfaces: with a little chemical product, it is possible to treat wider areas or tough dirt (also on ceilings, inclined and/or slippery walls).

They work at high-pressure and so they use spacious steel or stainless steel tanks to allow a greater working autonomy.

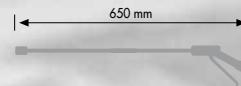

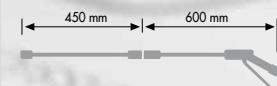

The chemical product spraying is a finishing phase of cleaning task with other machines. The choice of the right product considering the kind of cleaning task grants the best result, complying with the environment and the machine that sprays the chemical product. Our chemical products range has been conceived complying with the strictest rules protecting the environment and avoiding the indiscriminating use of products damaging the environment. The right measuring and respect of the instructions we suggest are the best balance of the economical and technical needs of each up-to-date and aware cleaning task.
